

1. You are in a war!!

Swapnaneel is the defence minister, heading a country faced with a war. Imagine the war field to be a $n \times m$ grid. The intelligence has come up with a report identifying positions of enemies in the grid. Of course, a person of his experience knows the positions of his troops. A soldier can move to a cell only if it shares a side with their current cell and does not contain a wall. Your task is to capture the strategic position at (n,m) . For that purpose, he can block any empty cell of the grid by a wall (including the (n,m) cell of the grid) in such a way that all of his troops must reach the position (n,m) and none of the enemies is able to reach the position. Swapnaneel has chosen you, his able lieutenant, to check if it is possible to capture the position.

Input conditions:

Each of the grid cells may represent the following:

- Empty — '.'
- Wall — '#'
- Friend Soldier — 'G'
- Enemy Soldier — 'B'

Note that; A cell that initially contains 'G' or 'B' cannot be blocked and can be travelled through. It is guaranteed that the cell (n,m) is empty.

Constraints:

First line contains a number of test cases t ($1 \leq t \leq 100$). First line of each test case contains two integers, n and m ($1 \leq n,m \leq 50$). The next n lines would contain m characters. Each of them being one of four above mentioned cases (empty, wall, friend soldier, enemy soldier) represented by corresponding letters.

Output:

Print a simple "YES" or "NO" denoting whether it is possible to capture the position. The output is case-sensitive.

Example:

Input:

```
6
1 1
.

1 2
G.

2 2
#B
G.

2 3
G.#
B#.

3 3
#B.
#..
GG.

2 2
#B
B.
```

Output:

```
YES
YES
NO
NO
YES
YES
```
