

So Mr.George recently joined college and he is too much fascinated by patterns. He was able to implement the following star pattern-

```
* *  
* * * *  
* * * * *  
* * * * * *
```

in which the no. of asterisk at a level NN is NN.

Now instead of just Asterisk, Mr.George also decided to use small alphabet o

So Patterns may look like these -

```
* *  
  
o o o o  
* * * * *  
* * * * * *  
  
o o o o o o o o o o
```

But he won't mix a row with both 'o'

,

o

,

and '*'

,

*

,

.

Now given He has AA no. of 'o'

,

o

,

and BB no. of '*'

,

*

,

, Tell the total ways he can implement a star pattern.

Since this no. can be very large, return it modulo 998244353998244353.

Explanation

Sample Case 1 -

Asterisk - 2

Alphabet O - 2

Possible patterns -

**

oo

**

oo oo

oo

** **

[execution time limit] 4 seconds (cpp)

[input] integer a

denotes the max no. of asterisk we can use.

$1 \leq a \leq 10^5$

[input] integer b

denotes the max no. of alphabet O's we can use.

$1 \leq b \leq 10^5$

[output] integer

find the total no. of ways of creating star patterns with given Asterisk and Alphabet O's
